Abstract (Basic): US 20030037649 A1

NOVELTY - The method involves sizing a potato (98), before leading the potato into a chamber. Water jets (100,102) are supplied into the chamber, to traverse the path of the potato within the chamber, such that the potato are cut into planting portions.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for the cut potato.

USE - For potatoes to be planted.

ADVANTAGE - Prevents transfer of bacteria and other pathogens between potatoes during or after cutting process. Allows application to existing potato cutting and planting machine.

DESCRIPTION OF DRAWING(S) - The figure shows the front view of the sanitary cutting process.

Abstract (Basic): WO 200215667 A2

NOVELTY - The disease preventing method comprises of sizing seed potatoes (98) for planting, supplying seed potatoes for cutting into seed, supplying a chamber with a water jet (50) passing across the chamber, moving the potatoes through the water jet and cutting the seed potatoes. The spent water jet is directed from the jet by a stream collector tube.

USE - For cutting potatoes

ADVANTAGE - Prevents the spread of pathogens or other bacteria..

DESCRIPTION OF DRAWING(S) - The drawing shows the front elevation detail view of the potato.

Abstract (Basic): US 6321484 B1

NOVELTY - Seed potatoes are cut by:

- (a) sizing seed potatoes using rollers (18);
- (b) supplying chambers, each having laser beam(s) (20) passing across the chamber;
- (c) moving the sized seed potatoes to the appropriate chamber;
- (d) passing the sized seed potato through the laser beam; and
- (e) cutting and cauterizing the seed potato with laser beam.

USE - For planting.

ADVANTAGE - The invention provides the cauterization of the cut that destroys pathogens contained within individual potatoes and ensures that other potatoes will not be infected. This increases the ultimate yield of the crop being planted and the profits made on the crop.

DESCRIPTION OF DRAWING(S) - The figure is a perspective view of a seed potato cutting machine.

RECORD TYPE: Abstract

LANGUAGE: English

ABSTRACT: A method of cutting seed potatoes prior to their planting is provided in which a laser beam is employed to slice the potatoes into the desired sized pieces. The present invention employs a plurality of laser cutting tubes and/or a multiple laser beam horizontal cutting areas which hold laser beam generating systems made up of laser beam sources that project the laser beams through the center of the cutting tubes or the cutting area and laser energy absorbers which contains the laser energy not used in the cutting process within the confines of the body of the invention. The laser beams bisect the cutting areas and as a potatoes pass through it the laser beams effectively cut the potato into the

desired size before it leaves the body of the present invention. Additionally, the use of a laser to cut seed potatoes prior to their planting also cauterizes the cut surfaces of the potatoes which ensures that any diseases contained within an individual seed potato will not be passed to additional potatoes during the cutting process.

Peeling potatoes using NaOH solution.)

Szymankiewicz, A.

Przemysl Spozywczy 1969 , 23 (6) 249-50

NOTE: 5 ref.

DOCUMENT TYPE: Journal Article

LANGUAGE: Polish

This study was carried out at the Int. Agric. Centre in Wageningen. 6 replications of 3 kg batches of washed G378BintjeG378 potatoes (40-50 mm) were used in a quarter-scale expt. installation. The potatoes were immersed for 4-6 min in tanks of 20% NaOH solution at 65 DEGREE C, (i) with or (ii) without addition of 2.5% AOAKITE-78 (aryl-alkyl sulphonate), and transferred to the washing unit, where skins and residual alkali were removed by water jets acting for 3 min at 6 atm. pressure. Mean wt. losses and numbers of eyes incompletely cleaned in 4, 5 or 6 min treatments respectively were: (i), 12.0, 17.4 and 20.6% and 99, 53 and 27; (ii), 8.8, 12.7 and 20.1% and 136, 94 and 34. Similar tests were also carried out with 1 min immersion in 20% NaOH solution at 90 DEGREE C and holding for 3, 4, 5 or 6 min before washing; wt. losses and numbers of incompletely cleaned eyes were greater (17.8-23.0% and 103-59) than with immersion at 65 DEGREE C, which is recommended. Processing techniques: the winning combination.

Anon.

Quick Frozen Foods 1978 , 40 (8) 37-38, 40, 43-45

DOCUMENT TYPE: Journal Article

LANGUAGE: English

Carnation is one of the largest US processors of frozen potatoes for the food service market. The 3 Washington plants and 1 Idaho plant process 4 million lb/day of potatoes. The processing cycle begins at the peeling tanks, where Russet Burbank potatoes are immersed in a hot caustic soda solution and thoroughly washed by high pressure water jets. The potatoes are then visually inspected for defects, all having imperfections are removed from the line, and any remaining skin, unpeeled eyes, bruises

and other blemishes are manually removed. Special high-speed Urschel cutters divide them into strips as long as 8 in. Shaker-sizers remove thin slivers, short pieces and chips after the cutting operation. After sizing, employees remove strips having discoloration and other defects. The strips then pass through a triple-stage **water** blanch to inactivate surface enzymes and neutralize **potato** sugar. The strips are hot-air dried before the double-stage frying operation. The fried **potato** strips pass over a vibrating belt to remove excess oil, are then conveyed on wire mesh to the tunnel to be blast frozen at -40 DEGREE F, then move through another sizing operation, before passing to the packaging line to be weighed and fed automatically into packages. ABSTRACT: A **water jet cutting** machine was used to **slice potato** tubers, and characteristics of the **cut** surfaces were studied. Irregularities on the **cut** face were visualized by staining with a nonspecific protein stain. The amount of protein extractable from the **cut** face was measured and used to quantitate the cellular damage resulting from different **water jet** operational conditions. Observations were confirmed with scanning electron microscopy. A wide range of **water jet** settings could be used to **cut potato slices**. French fries **cut** with the **water jet** set to cause intermediate subsurface damage had increased color irregularities but no extreme taste or textural differences compared to conventionally **cut** controls.

FOODLINE UPDATE CODE: 20010316

ABSTRACT: Developments in **cutting** and **slicing** technology for the baking industry are described. A cake-portioning system designed to overcome difficulties in **cutting** topped **fruit** cakes has been developed by ultrasonic technology specialist Branson Ultrasonics in association with RHM Technology. Relatively high moisture levels and differing densities of cake constituents pose severe practical problems in **cutting**. The ultrasonic proportioning system, which operates horizontally, is considered particularly suitable for cream cakes, tarts, flans and pies containing **fruit** and those with **meat** and **vegetable** mixtures. Ultrasonic **cutting** provides a practical and economic alternative to high-pressure water - jet cutting systems. **Vegetable** preparation units available from Gilberts Food Equipment include the Easy Tomato **Slicer**, the Easy Onion **Slicer** and the Easy Frycutter for **cutting** **potatoes** to make French fries - machines ergonomically designed for ease of use. The JBS Process Engineering **water** splitter for tin bread production is a simple and hygienic labour-saving alternative to traditional manual or mechanical blade splitting of dough located between the final prover and oven. Record Pelkman has designed the advanced Krumbein range of **food cutters** for use in ambient production of cakes and gateaux. Gasparin has developed blade and disc **cutting** systems using reciprocating blades, continuous blades or spinning discs.

Developments in sea **food** coating and other processing technologies are reviewed, focusing on possible processing problems and how they may be avoided. Individual aspects considered include: effects of product composition on processing (influence of high fat contents, moisture loss and connective tissue); processing considerations for double frozen sea **foods**; processing considerations for shaped sea **foods** (**water-jet** fish

portioning, single- and multi-cavity 3-dimensional shaping, **slicing** and sawing, internal binding systems); tempering of 'frozen-at-sea' fish blocks; emerging trends for flavour improvement; approaches to reduced fat absorption in frozen sea **foods** (use of overspray/dips before prefrying, use of non-fried coating systems); developments in fresh breadcrumb coatings (marketing and equipment considerations); and novel coatings for sea **foods** (beer-battered coatings, shredded **potato** coatings).

Results are given of a 3-year study at the Institute of Farm Machines and Fluid Power in Braunschweig, Germany, on the **water - jet cutting** of agricultural goods ( **potatoes** , sugarbeet, maize and maize stems, grasses and carrots). Besides ascertaining the functional relationships between the parameters of the **high-pressure water - jet cutting** tool and the various agricultural goods, an assessment of the **cutting** potential of the **water - jet cutting** tool and an analysis of the **cutting** process were conducted. 1 ref.

**Robotic high pressure water jet cutting of chuck slices .**

Heiland W K; Konstance R P; Craig J C Jr

U.S. DEP. AGRIC., 600 EAST MERMAID LANE, EASTERN REGIONAL RES. CENT., PHILADELPHIA, PA. 19118.

Journal of **Food Process Engineering** Vol.12, No.2, p.131-136, 1990.

ABSTRACT: With the objective of producing high quality and economical starting material for restructured beef products, the use of a high **pressure water jet** was investigated for excising objectionable material from **slices** of bone-in beef chuck. From the limited number of tests conducted, best conditions for a clean, smooth **cut** were obtained with a **water jet** orifice diameter of 0.15 mm (0.006 in), a **water pressure** of 380 MPa (55,000 PSI), a **slice** thickness of 19 mm (3/4 in) and a linear **cutting** speed of 10.9 m/min (430 in/min). A preliminary cost comparison indicated that a fully automated line had a greater economic advantage over the manual method.

Methods for removing young shoots in **fruiting** raspberries.

Sidorovich, A. S.

Selektsiya i Agrotekhnika Plodovo-Yagodnykh i Dekorativnykh Kul'tur.

p.102-112

Publication Year: 1985

Publisher: -- Novosibirsk, USSR

Language: Russian

Document Type: Miscellaneous

Secondary Journal Source: Referativnyi Zhurnal, 55 (Rasteniievodstvo), 1985, 9.55.743.

Interactions between manual, **chemical** and mechanical methods of removing young shoots were considered and optimal dates, shoot height, number of treatments, **chemicals** and their rates were determined. The most effective mechanical method was with a high **pressure** (100-200 atmospheres) **water jet** when the shoots were 15-20 cm high or by repeated **cutting** (3 or 4 times). Removal of young shoots increased yields by 1.5-2.2 times. 8 ref.

Language: English

Document Type: Journal article

A commercial mechanical strawberry harvester was tested on specially

prepared 0.61 m wide beds and 7 plant varieties; the **fruit** was graded in 3 categories and evaluated by **chemical** analysis and taste panels. Results indicate that once-over machine harvesting at the correct time gives 85-100% yield and adequate quality for some new cultivars grown in shaped beds. A prototype continuous-flow handling system was developed, with a dump-wash tank and plastic conveyor, a trash-eliminator-cleaner with 25 mm diam., 610 mm long counter-rotating rubber-covered rollers cleaned by **water jets**, and a vibrating washer with a tapered-finger sizing device. It processed 2 t/h for juice and puree products satisfactorily but did not remove calyxes; some hand-sorting of mouldy berries was necessary. ADDITIONAL ABSTRACT: The results are given of trials with a commercial model of a mechanical strawberry harvester, with several cvs and selections and 3 harvesting dates. In a once-over operation 80-100% of the crop was harvested, **fruit** quality being acceptable for processing. Good results were also obtained with a prototype continuous-flow system for cleaning and sizing machine-harvested strawberries to be used for juice or puree products. 12 ref.

ABSTRACT: On enforcement of 88/657/CEE Guidelines about **Meat** Trades Inside European Community, authors refer about a strong reduction of some bacteriological parameters values obtained in **meat** production after combined high pressure hot steam and Amphoteric Compound (Tego 51), environmental sanitation followed by high **pressure** hot rinsing **water jets**. No **pathogens** were found and reductions from 11 to 86 times of other bacteriological parameters were obtained for minced **meat**; less changes were found in chopped **meat** but very low values were present still before sanitation. Statistically significative differences in minced **meat** were very high for 32 degree C and 20 degree C Bacterial Counts, for Faecal Coliforms, E. coli and **apathogen** Staphylococci (p = 0,0001) but still good were those related to Faecal Streptococci (p = 0,0006) and to Total Coliforms (p = 0,0012).

New strategies for kiwifruit processing.  
Steele R J; Johnson R L  
CSIRO Div. Food Res. Sci. Technol., PO Box 52, North Ryde, NSW 2113,  
Australia.  
International Journal of Food Science & Technology Vol.30, No.1, p.13-21,  
1995.  
ABSTRACT: Improved strategies are presented for recovering the chloroplast  
fraction from kiwifruit. One strategy is to extract chlorophyll from the  
'peel', i.e. the outer 29% of the fruit, the remainder being processed to  
juice by conventional methods with the sacrifice of its chlorophyll  
content. This strategy recovers two-thirds of the chlorophyll content of  
the fruit and speeds the overall processing. A second strategy  
facilitates processing by washing the screens used for separating fruit  
tissues from chloroplast-containing juice. The washing with fine water  
jets cleans the screens in situ of the kiwifruit slime. It was also shown  
that chloroplast extracts when stored in a domestic freezer are stable for  
at least one year. Recombined frozen kiwifruit products such as sorbet and  
ice-cream are chlorophyll-colour stable for at least 7 months.

FOODLINE UPDATE CODE: 19971021  
ABSTRACT: In response to growing concerns about food safety and consumer  
demands for safer food, US company FMC Corporation has been working to  
develop a wide array of technologies to increase the safety of the food  
supply. FMC has attempted to reduce microbial contamination in thermal  
processing, process control, materials handling, and aseptic citrus  
processing. The steam pasteurization process has eliminated  
Escherichia coli, Salmonella, and Listeria from the surfaces of beef,  
poultry, and pork carcasses. Freezing and cooking processes to reduce  
safety risks in meats are also being developed. Waterjet  
Portioners use high-pressure water to eliminate the spread of  
pathogens from blades. Process control systems help processors comply  
with HACCP regulations. FMC technology allows commercial sterilization,  
chilling and storage of unconcentrated citrus juice.

SUMMARY LANGUAGE: English

DOCUMENT TYPE: Patent

FOODLINE UPDATE CODE: 20040520

ABSTRACT: A machine designed for trimming and chopping **vegetables**, such as green beans prior to freezing, is disclosed. The **vegetables**, aligned longitudinally, move along the tracks of a conveyor belt, above which is a group of **cutting** heads using high-pressure **water jets**. Each track has its own **cutting** head. A linear TV camera located in front of the **cutting** heads scans the **vegetables** and the separation between them. This information is used by an electronic control system to regulate the motors of the **cutting** heads and the conveyor belt, so that the **vegetables** are **cut** as required.

Publication Year: 1973

ISSN: 0001-2351

1 pl., 1 fig. --

Language: English

Document Type: Journal article

The effectiveness was assessed of 3 nozzle designs for **cutting** lettuce stems; other variables included nozzle-to-stem distance, harvesting speed, orifice diameter and **water pressure** up to 6000 lbf/in<sup>2</sup>. A total of 86 treatments proved capable of severing the stem, of which 54 employed an SDP (spray dry-P) model nozzle. Field harvesting systems employing this technique were considered feasible; power and **water** requirements would be adequate, and tank refilling would be necessary less frequently than unloading of harvested lettuce. 7 ref.

Language: English Document Type: ARTICLE

Abstract: A replicated experiment was conducted to determine optimum settings for orifice size, operating **pressure**, and nozzle traverse speed for **cutting** boneless chicken breast **meat** with high-**pressure water jets**. Three orifices of 0.076, 0.127 and 0.178 mm were tested with different **water pressures** in the 90 to 224 MPa range and nozzle traverse speeds in the 50 to 800 mm/s range. A 0.127-mm orifice working with **water pressure** in the range of 179 to 224 MPa and at 100 mm/s or slower **cutting** speed gave best results in this study to produce sharp clean **cuts**. **Water jets** from a 0.178-mm orifice frequently caused too much **meat** loss especially at higher wafer **pressures** and slower nozzle speeds. Variations in chicken filet thickness also had significant effect on chicken breast **meat cutting** quality and depth with both 0.076 and 0.127-mm orifices.

DOCUMENT TYPE: Journal article

FOODLINE UPDATE CODE: 19990512

ABSTRACT: High-pressure water-jet equipment for cutting meat and poultry products has been utilized to cut and portion muscle meats. The potential for expanding application of high-pressure water jets to meat cutting and deboning operations in primary poultry-processing operations has been examined. Research to determine possible removal of meat from non-eviscerated carcasses was conducted. Variables associated with this type of cutting were carried out using a prototype industrial robot. The cutting efficiency of high-pressure water jets was found to vary along the line of cut depending on various settings, meat thickness, temperature, and the presence of fat or connective fibrous tissue. Meat yield might be reduced if the cutting process of the water jet is not coherent with other cutting variables. A carcass-holding platform was developed for positioning the carcass in a neck-up position. Image-processing technology provided digital data for determining the cutting path along the centre line of breast meat and limb joints. Results showed that high-pressure water jets might be used effectively for separating chicken legs from the main body. At 33,00 psi, the water jet effectively sliced breast meat without penetrating the keel bone.

T3 Technical Textile Technology, v2, n4, pp6-9, 2003

Document type: journal article Language: English

Record type: Abstract

ABSTRACT:

Bereits im Mittelalter wurden Schnittschutzhemden aus Metallketten hergestellt, um die Soldaten vor den Wirkungen der Schwerter zu schuetzen. Dieses Prinzip wurde bis vor kurzem auch bei Schutzbekleidung fuer Fleischer angewendet. Der Nachteil der schweren und unbequemen Schutzkleidung wird durch neue schnittbestaendige Textilien vermieden. Es

gibt **jetzt** die Pruefnorm ASTM F1790-97, mit der solche gegen Schnittverletzungen schuetzende Bekleidung getestet werden kann. Die Produkte werden in 5 Klassen von Klasse 1 (= Baumwolle) bis Klasse 5 (= Stahl) eingestuft. Eine Neuentwicklung besteht aus EVA-beschichtetem ultrahochmolekularen Polyethylen (UHMWPE), die unter dem Namen Supreme Protector im Handel ist. Damit kann das Gewicht von 7 lbs/yd bei den Kettenmaterialien auf weniger als 2 lbs/yd gesenkt werden. Ein grosser Fleischverarbeiter hat diese Schutzkleidung kuerzlich eingefuehrt. Ein weiterer Bereich, der Schutzkleidung erfordert, ist das Schneiden mit Hochdruckwasser mit bis zu 40000 psi. Hierfuer wurde ein Aramidgewebe mit dem Namen TurtleSkin entwickelt. Weitere Kombinationen von Aramiden und fluessigkristallinen Polymeren wie PBO ergeben Schutzstufen von 3 bis 5. Honeywell kombiniert UHMWPE-Fasern mit Glasfasern unter dem Namen Spectra Guard. Fuer den Markt der schnittschuetzenden Materialien wird ein Wachstum von 3 - 4 % vorausgesagt. Weitere Informationen sind vom Autor unter Imra@charter.net oder telefonisch von den verschiedenen Herstellern zu erhalten.

Whole **watermelons** were dipped in **water** or hypochlorite solution, and then **cut** with a knife or **water jet**. **Cut** melons were stored at 4C for up to 14 days and tested for color, texture, pH, soluble solids, weight loss, and bacterial counts. Sanitizing dip and **cutting** method had no effect on pH or soluble solids. Sanitizing dip had no effect on color, texture, or weight. **Water jet-cut** melon pieces were darker, knife-**cut** pieces were softer and showed higher weight loss. Aerobic plate counts for all treatments increased by up to 5 log cycles during storage. A **precut** sanitizing dip resulted in about a two log cycle reduction in initial aerobic and about a one log cycle reduction in initial coliform bacterial counts.

FOODLINE UPDATE CODE: 19870714

ABSTRACT: The invention relates to a method for **slicing fruits and vegetables** that minimises tissue damage and thus prolongs shelf-life. A high-**pressure water jet** of about 30,000 to about 50,000 psi is used to **cut the fruit or vegetable**. Examples are given comparing this with other **cutting** techniques, evaluating sensory quality, microflora and shelf-life.

LANGUAGE: English

DOCUMENT TYPE: Patent

FOODLINE UPDATE CODE: 19991112

ABSTRACT: Elongated **vegetables** such as carrots, parsnips and cucumbers require end-trimming and **cutting** into segments to prepare them for processing and subsequent packaging. This invention concerns a method and apparatus for trimming the ends of this type of **vegetable**, and, optionally, **cutting** them into segments of specified lengths. Existing systems use mechanical means to orient the produce, are complex and labour-intensive to maintain, and can be difficult to operate at high speeds. The use of **water jets** in the apparatus of the invention for positioning the **vegetables** enables a reduction in the number of mechanical parts, improved control and reduced machinery and maintenance costs.

Flow International announces joint project with Kraft, ConAgra, others.

**Food** Engineering, 72, 9, 24

Sept, 2000

TEXT:

**Waterjet** manufacturer Flow International Corporation has signed agreements with Kraft **Foods**, ConAgra, Procter and Gamble, the U.S. Army Soldier Command, and the National Center for **Food** Safety and Technology at the Illinois Institute of Technology to jointly develop the use of ultrahigh-**pressure** technology to produce high-quality, shelf-stable **food** products. The \$2.3 million, three-year effort -- part of a Department of Defense, Dual Use Science and Technology Program -- will address the regulatory, quality and hardware aspects of the commercial production of **foods** that can be kept for extended periods of time without refrigeration. Development efforts will focus on low-acid, heat-sensitive **foods**, including soups, **potatoes**, and cheese products, for both military and consumer markets.

Our goal is to use ultrahigh-**pressure**, instead of the high heat and long cooking times required for traditional canning, to produce room-temperature, shelf-stable **foods** with nutritional value, flavor, color, and texture unachievable today," said Ron Tarrant, chairman, president and CEO of Flow International, which manufactures ultrahigh-**pressure waterjet** technology for **cutting**, cleaning and **food** safety applications.

The company's Fresher Under **Pressure** food safety system utilizes ultrahigh **pressure**, rather than high temperatures, to destroy food-borne **pathogens** and spoilage microorganisms. Fresher Under **Pressure** is currently used to extend the shelf life of refrigerated products, such as seafood, juices and cold **cuts**. The technology is also used to destroy harmful **bacteria**.

Tarrant urged **food** companies to join Flow and others in their development efforts. Interested companies should contact Dr. Edmund Ting, vice president of research and development at (253) 813-3346 or eting@flowcorp.com.

ABSTRACT:  
**Water jet** knives can provide precision-controlled, high-pressure poultry **cutting** to achieve intricacy and a more natural look, according to J Craig Wyvill, senior research engineer at Georgia Tech Research Inst. **Water jet** knives eliminate waste build-up and prevent the transfer of contamination to the **meat** . They can also be safer vs steel knives by eliminating the possibility of operators' hands being pulled into the blade. **Water jet** knives also do not dull from contact with such hard surfaces as bone and **cutting** surfaces. **Water jet** knives, however, have limited penetration of about a few inches, although polymers and abrasive **additives** can increase penetration depth. Used in the poultry processing industry, **water jet** knives can provide more automated production of intricately portioned **cuts** .

**FLOW SYSTEMS WATERJETS WELCOMED IN THE COMPETITIVE FOOD INDUSTRY.**  
NEWS RELEASE September 30, 1986 p. 11

Food processors are quietly welcoming the newest weapon in their  
production arsenal -- **waterjet** cutting .The technology, pioneered by  
Flow Systems, Inc., offers canners, packers and processors a tool to reduce  
waste, increase production- line speed and capacity, and increase prodits  
in a competitive industry where profit margins are slim. Flow Systems  
installed its first production **waterjet** cutting system in the food  
industry after several years of research and development, in-plant testing  
by cooperating food processors, and gaining USDA apparoval. The firm's  
equipment also is approved for use with other cutting fluids such as  
**vegetable oils, glycerin and alcohol for water-sensitive foods.** Flow  
Systems now has more than a dozen production-line installations cutting  
foods such as fish, meat , poultry, vegetables , pitted olives, pizza,

granola bars, sheet cake and candy. Within the next five years, the firm predicts that its sales to food processing companies will grow at a 50 percent annual rate.

Lean machine **cuts** fat from **meat**.

Photonics Spectra, p120

Oct, 1996

Language: English Record Type: Abstract

Document Type: Magazine/Journal; Trade

ABSTRACT:

Elrad Ltd., of Petach-Tikva, Israel, has created a 3-D scanning and **slicing** machine, called as the CompuScan 300, that control, without human contact, the amount of fat left in **meat**. The development of CompuScan 300 is a response to consumers growing consciousness on sanitation and fat intake. CompuScan is mainly composed of a 3-D vision system and a computerized high-pressure **water-jet cutting** system. Via a camera connected to the vision system, the **meat** is scanned for fat, and 3-D measurements are taken. The data is then relayed to the **water-jet cutter**, which **slices** the fat from the **meat**. With CompuScan, uniformity of the **meat** in volume, size and weight, is achieved.

Two steaks please, robot

Times (London, UK) November 23, 1989 p. 35

UK: The **Meat** and Livestock Commission, a govt agency, has launched a  
GBP1 mil plan to produce the UK's first robot machine to **cut meat** joints.  
The commission will spend up to GBP500k on the first prototype, which will  
be finished by end-1990. Some 200 robots should be finished by 1994. The  
robot butcher, which can work non-stop, is expected to have electronic  
sensors, eyes and arms to lift and position the carcass on the **cutting**  
table, for **cutting** into joints by saws, a rotating knife, or a  
high-**pressure water jet**. The commission hopes the **meat** firms will  
invest an extra GBP500k to produce models to suit their needs.

World Wise Technologies subsidiary, BWH delivers prototype to Ontario Hydro

Technologies and enters a joint product development agreement with ESI.

Business Wire, p11091346

Nov 9, 1995

TEXT:

MARKHAM, Ontario--(BUSINESS WIRE)--Nov. 9, 1995--World Wise  
Technologies Inc. is pleased to announce that its subsidiary, BWH  
Technologies Inc. ("BWH") has delivered its first product, a micro-hydro  
personal generator prototype, to Ontario Hydro Technologies (OHT).

OHT is a wholly owned subsidiary of Ontario Hydro, one of North  
America's largest utilities. OHT has acquired the conceptual rights in  
addition to the exclusive marketing rights for the product. BWH retains the  
manufacturing rights.

The product is targeted at campers, boaters, hunters and other outdoor  
recreational consumers. The personal generator will produce up to 500 watts  
of electricity, and is capable of providing sufficient power to operate  
televisions, household lights and battery recharging systems. Weighing

approximately 20 lbs., it can be placed in a **stream**, or clamped to the side of a sailboat.

World Wise Technologies Inc. is also pleased to announce that BWH has entered into a joint Product Development Agreement with Engineering Services Inc. (ESI) to produce an automated, robotic, **water-jet cutting** system for use in the **food** processing industry. The companies intend to focus their initial development efforts on solutions to meet the requirements of the Canadian **meat cutting** industry.

ESI is a spin-off of the highly regarded Robotics and Automation Laboratory (RAL) at the University of Toronto. It is headed by Dr. Andrew Goldenberg (Director of RAL) and has pioneered research and development of flexible, automated robotic solutions. The Robotic Systems developed by ESI and RAL have been implemented by a number of Canadian companies and industries including Ontario Hydro, IBM Canada and Northern Telecom.

Together BWH and ESI will develop an automated **meat cutting** system (AMCS) that will incorporate a twin-arm, omni-directional robotic system directing the **waterjet cutting** nozzles. The product is targeted to be suitable for the poultry, beef and pork industries. Dr. Ananth Seshan, executive vice-president of ESI states that, "the Pork industry alone, represents a \$50 million global business opportunity over the next five years."

INGERSOLL RAND OFFERS **WATER - JET CUTTING TRIALS**

Advanced Composites Bulletin, pN/A

Oct, 1990

TEXT:

Ingersoll Rand, Bolton, UK, which manufactures specialized **water-jet cutting** equipment, has responded to increased demand for sample **cutting** from its four European laboratories by offering a fast **cutting** service from its operation in The Netherlands.

Straight line **cutting** trials are normally conducted free of charge; complex shapes will incur charges from 60-125/hour, depending on the level of programming required for the computer-controlled **cutting** equipment.

The company reports that this has been a record year for enquiries into **water - jet cutters** that can cope with everything from fish and **meat** to titanium and composites. The company has established a rapid response hotline number for enquiries.

For further information, contact: Ingersoll-Rand Information Centre, Freepost Conrad House, Birmingham Road, Straford-upon-Avon, Warwickshire CV37 0BR, UK; tel (in UK): 0800-444222.

DOCUMENT TYPE: Journal article

FOODLINE UPDATE CODE: 19940426

ABSTRACT: The use of high-voltage electric field processing to reduce **microorganisms** in **food** is briefly described. Research on the applications of pulsed electric fields, as a method of pasteurisation, is summarised. The **antimicrobial** effects of short pulses of intense light are of interest. Inhibition of surface **microbial** and enzymic activity on solid foods, using this method, has been reported. Novel slicing and cutting techniques are briefly outlined, including abrasive water - jet cutting, and laser cutting and peeling. It is reported that the Campden Food RA has reviewed technology transfer opportunities in this area.

Archiv fuer Lebensmittelhygiene 2001 , 52 (1) 10-13

NOTE: 16 ref.

DOCUMENT TYPE: Journal Article ISSN: 0003-925X

LANGUAGE: English SUMMARY LANGUAGE: German

Studies were carried out to identify the microbiological critical control points during processing of sardines as part of a project to evaluate the bacteriological safety of canned products (fish in oil, fish in tomato sauce), made from fish of the Clupeidae family. There were frequent positive findings for Enterococcus spp., **Escherichia coli** and coagulase-positive **Staphylococcus** in swabs taken from the skin of fish during various processing phases and from work surfaces, indicating a possible risk for production. It is suggested that this risk can be controlled through implementation of HACCP and by vigorous process control which should include phases of steam and hot air cooking (100-130 DEGREE C/30 min) and sterilization (116 DEGREE C/35-50 min). Further recommendations are also made with regard to ice packing, cooling, fast freezing, frozen storage and rapid defrosting using **water jets**.

**FLOW'S HIGH-PRESSURE JETS AIMED AT RAW OYSTERS**

Virgin, Bill  
Seattle Post-Intelligencer (Seattle, WA, US) pE.1  
PUBL DATE: 990505  
WORD COUNT: 411  
DATELINE: Kent, WA, US, Pacific  
TEXT:

Flow International Inc. has assembled something of a dinner menu out of the contracts it has signed for using its **high-pressure** technology to treat food.

The latest addition to the contracts it has signed with companies that make juice and guacamole: Raw oysters.

Motivatit Seafood in Houma, La., plans to use Flow's high-pressure systems for neutralizing the *Vibrio vulnificus* bacteria that can be carried in raw oysters.

Flow, whose main business is **high-pressure water jets** used for industrial cutting and cleaning, has been developing a second business of using high pressure to break up the microorganisms that cause **disease** or spoilage in **food**. The Kent-based company says pressure treating doesn't affect the taste, color and nutritional value of food the way pasteurization with heat can.

In the case of oysters, pressure treatment has an added benefit, said

Rick Marshall, Flow's vice president of corporate market and application development. The pressure helps force open the shell, saving time in shucking the oyster meat.

At the same time, pressure doesn't flatten or disfigure the meat, Marshall said, because the pressure is coming from all directions and because the water content of the food is so high. The oysters are subjected to pressures of 55,000 pounds per square inch for up to two minutes.

"We're very excited about the seafood market," said Marshall, adding that he's had inquiries from other companies in that business.

Before the latest agreement Flow's contracts had been for "pumpable" liquid or semi-liquid foods. By putting together an array of pressure vessels Flow could set up a continuous system (one is filling while one is under pressure and another is emptying).

Marshall said Flow's system can be operated as a batch process, but because manually unloading the container takes time "it's a bit small" to be operated that way.

Still, Flow was able to snare the contract because it could get a unit to Motivatit faster than competitors who build pressure systems.

And with Flow's acquisition of the high-pressure systems division of a Swedish company, it will be able to offer customers like Motivatit larger, batch-style units.

So far Flow's venture into treating food with pressure isn't generating revenue for the company. Stephen Reichenbach, Flow's chief financial officer, said revenues from leases and royalty fees on the units will start making a significant contribution to revenue toward the end of fiscal year 2000, which for Flow started last weekend.

P-I reporter Bill Virgin can be reached at 206-448-8319 or billvirgin@seattle-pi.com

DE 60007809 E A23N-015/00 Based on patent EP 1074187

Abstract (Basic): EP 1074187 A2

NOVELTY - A raw **vegetable** or **fruit** product is simultaneously **sliced** and washed by delivering the **food** product to a centrifugal-type **slicer** (21) having a rotatable cage and **slicing** knives. The **slicer** is immersed in a **water** bath (12), and the **slicer** cage is rotated to force the product through the knives and into the **water** bath. **Slices** (14) are impelled through the **water** (13) and then removed.

USE - The invention is used for simultaneously **slicing** and washing a firm, raw **vegetable** or **fruit** product, e.g. **potatoes**, apples, sweet **potatoes**, cassava, plantains, beets, onions, **water** chestnuts, carrots, turnips, cabbage or sugar beets (claimed). It can also be used for the removal of starch and ruptured cells.

ADVANTAGE - The invention eliminates the separate washing step following **slicing** in **vegetable** processing through combining the **slicing** and washing steps. It effects a savings in processing time and equipment expense. It minimizes **slice** overlap, thus reducing the tendency to form clumps of the **sliced** product in subsequent frying steps. It provides for the complete removal of **slices** from the **slice**-washing bath irrespective of the vortexes or turbulence.

DESCRIPTION OF DRAWING(S) - The figure shows a perspective view of the **vegetable slicing** and washing apparatus.

**Water** bath (12)

**Water** (13)

**Slices** (14)

**Slicer** (21)

US 4751094	A	4			
------------	---	---	--	--	--

Abstract (Basic): EP 223111 A

Method comprises using a **water jet** discharging from an orifice at 30,000-50,000 psi **pressure** to **cut** a fresh **fruit** or **vegetable** so as to minimise bruising throughout the **cut** pieces and tissue damage at the **cut** surfaces.

USE/ADVANTAGE - The **cutting** method is partic. useful for **vegetables** such as carrots (claimed), celery (claimed), cucumber, green pepper, lettuce, cabbage, **potatoes**, turnips, rutabaga, string beans, radishes, rhubarb and swiss chard, and **fruits** such as oranges, **grapefruit**, lemons, limes, apples, pears, pineapples, cantaloupes, honeydew melons and **water** melons. Tissue damage due to compression and tearing is minimised. The shelf life of the **cut fruit** or **vegetables** is prolonged. Microbial and enzymatic damage is slowed down due to the formation at the **cut** surfaces of a very thin dry layer.

0/0

Abstract (Equivalent): US 4751094 A

Improved method of **cutting** a fresh **fruit** and **vegetable** comprises contacting with a **water jet** discharged from an orifice at 30,000-50,000 psi to **cut fruit** or **vegetable** into pieces, such that bruising and damage to tissue near the **cut** surface is minimised throughout. Pref. **water jet** discharges from orifice of dia. 0.003-0.012 ins.

USE - To **cut** carrots or celery, or other fresh root **vegetables**, leafy **vegetables**, or those having firm tissue. **Fruits** (e.g. oranges, **grapefruits**, lemon, etc) can be similarly treated. (4pp)

Priority Applications (No Type Date): US 67646023 A 19670614

Abstract (Basic): US 3574643 A

Raw potatoes are immersed in an aqueous 4-10 wt.% caustic soln. heated to 185-212 degrees F for 1-5 minutes and then removed while retaining a film of solution on the potatoes, the potatoes are kept for 5-30 minutes in the coated state to impregnation and then water jets are played on then to remove the skins. The potatoes are neutralised with acid, sliced, pre-cooked, cooled, cooked, riced, dried and packaged. Preferably they are preheated to 155-185 degrees F for 1-5 minutes before being immersed in caustic solution. The method and apparatus for carrying out the process results in greater economy, the wash water, caustic solution and heating fluids being recirculated.

Abstract (Basic): EP 224713 A

Process comprises selecting petioles from a vegetable and subdividing before cooling in water at 1 deg.C. Cooled petiole sections are packaged in an envelope which prevents microbial recontamination. The petioles are selected to have physiological and chemical properties characteristic of the vegetable in its mature state and the chilling process lasts for 2-5 mins.

Petioles are selected to have a protein content of 0.98% w/w and an ash of less than 0.85% w/w. The physiological properties of the petioles are a lack of pithiness and 9-12 tissue cells per mm. Selected petiole is **cut** by a razor-thin blade which follows a sawing motion. Alternatively, the **cutting** is performed by a **water jet** with a 0.008 inch orifice operated at 40000 psi.

Pref. the packaging envelope is foamed polypropylene with a gas permeability of 50-300 cc O<sub>2</sub> per 100 sq. inch per 24 hrs.; 200-800 cc CO<sub>2</sub> per 100 sq. inch per 24 hrs.; and a moisture transmission rate of 1.5 gms/100 sq.in/24 hrs. at 70 deg.F and 90% RH.

USE/ADVANTAGE - The **vegetable** used is celery and process extends its shelf-life.

0/0

Abstract (Equivalent): EP 224713 B

A process to maintain in a viable form a fresh **vegetable** having enlarged petioles as a predominant feature which comprises; (a) selecting a petiole of a **vegetable** enlarged petioles as a predominant feature, said petiole having **chemical** and physiological properties characteristic of the petioles of the **vegetable** in its market mature state, which provide acceptable shelf life, the **chemical** properties including protein of about 0.98% by weight and above and ash of less than about 0.85% by weight, and the physiological properties including tissue cells having a size of about 9 to about 12 cells per mm and a lack of pithiness in the **cut** surface of the petiole, (b) **cutting** said selected petiole into pieces in a manner effective to minimise bruising throughout the **cut** pieces and damaging of tissue in the vicinity of the **cut** surfaces, (c) contacting said petiole pieces with **water** at about 1deg.C to about ambient temperature for about 2 to about 5 minutes, (d) removing surface **water** from said petiole pieces, and (e) packaging said petiole pieces in a sealed container effective to prevent microbial recontamination of said petiole pieces, said container having a gas permeability and a ratio of the mass of said petiole pieces to the container surface effective to maintain said petiole pieces in a viable condition, the gas permeability being about 50 to about 300 cm<sup>3</sup> of O<sub>2</sub>/645 cm<sup>2</sup> (100 in<sup>2</sup>) - atm. - 24 hrs., about 200 to about 88 cm<sup>3</sup> of CO<sub>2</sub>/645 cm<sup>2</sup> (100 in<sup>2</sup>) - atm. - 24 hrs., and a moisture transmission rate of less than about 1.5 g/645 cm<sup>2</sup> (100 in<sup>2</sup>) - 24 hrs. - 90% R.H., 21.1 deg.C (70deg.

Abstract (Equivalent): US 4753808 A

Improved packaged **vegetable** prod. comprises a shelf-stable fresh **vegetable** having enlarged petioles or the main feature. Prepn. comprises (a) selecting petiole having **chemical** and physiological properties in its market mature state providing acceptable shelf life; (b) **cutting** it into pieces so as to minimise bruising and damage to tissue near **cut** surface; (c) contacting pieces with **water** at 1 deg.C to ambient temp. for 2-5 mins; (d) removing surface **water**; and (e) packaging the pieces in a sealed container to prevent microbial recontamination. **Chemical** properties of petiole include 0.98 wt% protein and less than 0.85 wt% ash; and physiological properties include tissue cell size of 9-12 cells per mm. and lack of pithiness in **cut** surface. Container has gas permeability and ratio of pieces to container surface to maintain pieces in a viable condition. Gas permeability is 50-300 cc O<sub>2</sub> per 100 sq.in.atmos. 24 hrs; and moisture transmission rate less than 1.5 g per 100 sq.in. 24 hrs. 90% relative humidity 70 deg.C. Ratio mass of pieces to container surfaces is 1-6 g per sq.in.

USE - For packaging celery. (8pp)r

US 4711789 A

Fresh **vegetable** having enlarged particles is maintained in viable form by (a) **cutting** selected petiole so as to minimise bruising throughout the piece and damaging tissue near the **cut** surface; (b) contacting pieces with **water** at 1 deg.C to ambient temp. for 2-5 mins; removing surface **water** from pieces, and (d) packaging pieces in a sealed container to prevent microbial contamination. Petioles have **chemical** and physiological properties characteristic of those of the **vegetable** in its market mature state which provide acceptable shelf life, contg. 0.98 wt.% or more of protein and less than 0.85 wt.% of ash, having 9-12 tissue cells per mm and lack of pithiness in the **cut** surface. Container has gas permeability and ratio of mass of petiole pieces: container surface in amt. to maintain pieces viably. Gas permeability is 50-300 -c O<sub>3</sub> per 100 sq. in atmos. 24 hrs.; 200-800 cc CO<sub>2</sub> per 100 sq.in-atmos-24 hrs., and moisture transmission rate of less than 1.5g per 100 sq.in. 24 hrs-90% relative humidity at 70 deg.C. Ratio of mass of petiole pieces: container surface is 1-6 g per sq. in..

USE - To maintain raw celery in viable form. (5pp)i

FILED: February 10, 1982 (19820210)

#### ABSTRACT

PURPOSE: To carry out the automatic cleaning of **vegetables**, aseptically, by connecting a unit for rough washing with **water**, a unit for washing with a **chemical** solution, and a unit for the final washing with **water** in series. CONSTITUTION: Properly **cut vegetables** 10 are put through the inlet 23 into the chute 11, and dropped into the **water** in the unit 17 for the rough washing with **water** by the **water jet** ejected through the **jet** nozzle 6. The **vegetables** are roughly washed by the **water jets** from the upper and the lower nozzles 12, 12' and transferred by the conveyor 13 to the unit 18 for washing with a **chemical** solution. In the unit 18, the **vegetables** are washed by the **jet of chemical solution** ejected through the nozzles 12, 12, and transferred by the conveyor 13 to the unit 19 for the final washing with **water**. The **vegetables** washed with the **water jet** through the nozzles 12, 12' in the final washing unit 19 is discharged by the conveyor 13 through the outlet 24.

Abstract (Basic): WO 200153259 A1

NOVELTY - Pyrrolecarboxamide and pyrrolethioamide derivatives (I)  
are new.

DETAILED DESCRIPTION - Pyrrolecarboxamide and pyrrolethioamide  
compounds of formula (I) are new.

X=O or S;

R1=optionally substituted 1-4C alkyl, except CF3, optionally  
substituted 3-5C cycloalkyl, or halo;

R2=H, optionally substituted 1-4C alkyl, optionally substituted  
1-4C alkoxy, CN or halo;

R3=optionally substituted 1-4C alkyl, and

A=orthosubstituted aryl, orthosubstituted heteroaryl, optionally  
substituted bicycloaryl, or optionally substituted bicycloheteroaryl.

INDEPENDENT CLAIMS are included for the following:

(1) preparation of (I), and

(2) pyrrole carboxylic acid derivatives of formula (X).

ACTIVITY - Fungicidal; antibacterial; virucide; pesticidal.

Tests are described but no results are given.

MECHANISM OF ACTION - None given.

USE - Used for controlling microorganisms and preventing attack and  
infestation of plants, particularly for controlling or preventing  
infestation of cultivated plants by phytopathogenic microorganisms  
(claimed). (I) Can be used to inhibit or destroy pests that occur on  
plants or parts of plants ( **fruit** , blossoms, leaves, stems, tubers,  
roots) of different crops of useful plants, while at the same time  
protecting also those parts of the plants that grow later. (I) May also  
be used as dressing agents for the treatment of plant propagation  
material, in particular of seeds ( **fruit** , tubers, grains) and plant  
**cuttings** (e.g. rice), for the protection against fungal **infections** as  
well as against phytopathogenic fungi occurring in the soil.

(I) Are effective against phytopathogenic fungi of the following  
classes: Fungi imperfecta (e.g. Botrytis, Pyricularia,  
Helminthosporium, Fusarium, Septoria, Cercospora, and Alternaria) and  
Basidiomycetes (e.g. Rhizoctonia, Hemileia, Puccinia). (I) Are also  
effective against the Ascomycetes classes (e.g. Venturia and Erysiphe,  
Podosphaera, Monilinia, Uncinula) and of the Oomycetes classes (e.g.  
Phytophthora, Pythium, Plasmopara), particularly powdery mildew  
(Erysiphe spp). (I) Are also effective against phytopathogenic bacteria  
and viruses (e.g. Xanthomonas spp., Pseudomonas spp., Erwinia amylovora

and against the tobacco mosaic virus).

ADVANTAGE - (I) Have good activity at low rates of application and are well tolerated by plants and are environmentally safe.

Abstract (Basic): DE 19842054 A1

NOVELTY - Cleaning agent based on NaHCO<sub>3</sub>, NaCl and/or sugar together with a **water**-soluble polymeric polycarboxylate as dispersing agent, a chelating agent and/or a surfactant.

DETAILED DESCRIPTION - Cleaning agent based on Na bicarbonate, Na chloride and/or sugar as carrier which contains in the form of a powder or an aqueous formulation (a) a **water**-soluble polymeric polycarboxylate (I) as dispersing agent, (b) a chelating agent and/or (c) a surfactant.

USE - The agents are useful for the abrasive cleaning of hard surfaces e.g. of metals, masonry, building facades, etc., to remove adherent deposits of dirt on the surface e.g. mineral, **vegetable** and animal oils, fats, waxes, salts, ash, powders, granules, dust, pigments, fillers, carbon black, tar, organic polymers, etc., using a

dry sand blasting or water jet stream application technique with or without compressed air.

ADVANTAGE - The compositions give excellent penetration through the dirt layer, wetting of the surface to be cleaned, lifting of the deposited dirt and good entrainment and removal of the dislodged dirt away from the surface being cleaned. The ingredients of the composition are environmentally benign and represent no hazards to the health of personnel working with the material.

ABSTRACT EP 1374689 A1

A description is given of a novel frozen **potato**, similar to fresh **potato** but with a lower starch content and retaining a lower quantity of oil when fried than par-fried frozen **potatoes** that exist on the market. To this end, the **potatoes** undergo a treatment in a saline solution followed later, or in the actual previous stage, by the addition of a **food preservative/anti-oxidant**, which treatments may optionally be followed by stages of drying with hot air, addition of a color

homogenizer, basifying and structure stabilizer for the **potato**, cooling in a solution with optional addition of **food** colors and/or flavors, according to the different variant embodiments of the general process that are considered, and all the aforesaid previously undergoing a stage of drying by means of laminar airflow, prior to their freezing. This type of **potato** may be used in catering in general, being particularly recommended for its low calorie content.

...SPECIFICATION manufacturing diagram in Fig. 1.

Preliminary stages (1-5)

The preliminary stages of preparing the **potato** are those of washing, peeling, selecting, **cutting**, partial destarching (which, according to the **cutting** method used, may take place at the same time as the **cutting** operation, as is the case of **cutting** using a **water jet**) and stage-two selecting to eliminate marks. All these stages are common and are carried...

INTERNATIONAL PATENT CLASS: A47J-037/12  
ABSTRACT EP 758538 A1

This invention is related to a process and automatic apparatus of novel system concept for delivering formatted, freshly fried **potato** products from dehydrated **potato**. The process comprises the steps of measuring the temperature of frying oil during the frying time; computing the introduced energy amount by integrating the temperature of frying oil on frying time; and determining the termination of frying time on the term that said introduced energy amount equals to a predetermined constant value.

The apparatus according to the present invention comprises at least two temperature sensors located on different height levels in the frying unit (7); a unit to average the signals of said temperature sensors during frying time and to integrate the averaged temperature of the frying oil on the frying time, and thereby computing the amount of the introduced energy. Said unit controls the interruption of frying in case of attaining a predetermined constant amount of energy to be introduced.

ABSTRACT EP 693348 A1

Potatoes are conveyed one at a time along a predetermined path (37) ending at a cutter (150) that cuts the potatoes into helical strips. A series of four rings (40,50,60,70) surrounds the path. Each ring has a plurality of nozzles (90) that produce jets of water intersecting at a point in the path. At the outlet of the series of four rings (40,50,60,70) is an orienter (140) through which the potatoes pass. The rings (40,50,60,70) and the orienter (140) align and guide the potatoes as they move along the path (37) and through the cutter (150). (see image in original document)

English Abstract

A food product cutting apparatus (10) that makes a substantially horizontal cut through food product being delivered in a substantially vertical direction. The food product delivered to a cutting device (12) through an internal passage (24) of at least one feed member (22) above the cutting device. A force is applied to the food product traveling downward through the internal passage (24) so as to push the food product against a first wall (26) of the feed member (22). The apparatus is configured to improve product flow by configuring the passage (24) of the feed member (22) to have a cross-sectional shape defined by two offset, overlapping diameters. The apparatus is also configured for improved safety by ensuring that the cutting device (10) is properly secured before electrical power is available for driving the cutting device (10).

English Abstract

An apparatus (10) for **cutting food** product so that the product is properly oriented and stabilized before and throughout the **cutting** operation to produce a **sliced** product of uniform thickness, even if the delivered **food** product varies in shape and size, such as when both round and elongate **potatoes** are used to produce **potato** chips. The apparatus (10) includes a **cutting** device (12) and housing thereabove that defines a passage (50, 32, 132) with an opening (44) in proximity to the **cutting** device (12), such that **food** product is delivered to the **cutting** device (12) in a substantially vertical direction. To improve the stability of round product during the **cutting** operation, the housing has an upper portion (40, 140) and a flared lower portion (42, 142) immediately below the upper portion (40, 140) so that at least a portion of the opening (44) of the passage is defined by the flared region (56, 156) and has a larger radius of curvature than the upper portion (40, 140).

Fulltext Availability: Detailed Description

Detailed Description

... tapered flared region 56 or 156 acting to trap and center round **potatoes** against the **cutting** wheel 12, thereby reducing the incidence of tapered **slices** caused when the product rotates about an axis that is roughly parallel to the direction of the **cut** made by the **cutting** wheel 12. In the embodiment depicted in Figure 3, the tapered region 56 has a...  
...below the wall 48 or 148 of the upper portion 40 or 140 opposite the **water jets** 52 and 152. In such an embodiment, the portions of the openings 44 and...

English Abstract

**Meat** is processed under conditions preserving its quality and hygiene.

Process steps, particularly those in which new **meat** surfaces are generated, are carried out in an atmosphere comprising CO<sub>2</sub> and excluding O<sub>2</sub>. UV may be used for germicidal action. The **meat** temperature is preferably kept between 0 and -2(deg)C. Particularly for red **meats**, the CO<sub>2</sub> content is controlled to maintain a surface pH of 3.5 or less.

Fulltext Availability: Claims

Claim

... However such energies permeate deep into the **foodstuff** and as such are unnecessary for raw **meat** and similar compounds which only suffer from surface contamination. Such energies also generate large amounts of heat, a component that all raw **meat** operations need to avoid or minimize to permeate product denaturation. Actinic reactions primarily occur in...  
...**water** activities and low acidic pH. Examples of **foods** of this type are winter pineapple, **fruit** juices and milk. While fresh **meat** under normal atmospheric conditions has a aW of up to 0.99, frozen **meat** or **meat** with a dried surface have much lower aW. Also the pH of raw beef is usually in the range pH5 6.0 with other **meats** showing a similar range. As such it is possible to use other methods to reduce...  
...the product and prevent 10 or minimize the formation of breakdown products that would affect **meat** quality and keeping quality attributes. Thus the primary source of loss of **meat** quality and keeping quality is oxygen and by-products generated by oxidative reactions. Controlled atmosphere...  
...also details the alleged advantages of low oxygen or no oxygen gas mixtures for preserving **meat** quality attributes. However the typical volumes of gases found in such packages exert there preserving...  
...any substantive  
...decontamination effect nor by significantly modifying any of the physical properties of the **meat**.  
Therefore a need exists to better control the **meat** processing environment and the materials being processed

within it so as to more effectively reduce...

...sources of cross contamination and recontamination within that environment and simultaneously maintain or improve the **meat** quality and keeping quality attributes of the products processed and produced within that system...

...of the following:

- (i) to reduce or obviate the drawbacks of using decontamination methods for **meat** which may rely entirely or in part, on **chemical** methods;
- (ii) to reduce or obviate the limitations of decontamination methods for **meat** which principally rely on adding powders, **water**, solutions or other liquids to raw **meat** and its subsequent products such that either the volume of **water** added may either exceed the natural proportions normally found in raw **meat** and its products and/or may require labelling of the fact, accordingly;
- (iii) to provide...

...can enhance the decontamination capabilities of the system by changing the physical properties of the **meat** to make the surfaces of both the raw **foodstuff** materials, their intermediate and finished products...

...to the decontamination treatment and as a consequence enhance the keeping qualities of the raw **meat** and its products so formed. These objects can be provided by pre-grinding (if necessary) the **meat** to a substantially uniform size and exposing the freshly ground **meat** particle surfaces to a sufficient quantity of carbon dioxide gas such that the pH at the surface of the **meat** is reduced to pH 3.5 or less and a suitable narrow wavelength, germicidal UV...

...a gas which becomes active on contacting the carbon dioxide enriched surface of the ground **meat** ;

- (iv) to minimize sources of recontamination and cross contamination within the processing environment generated or...

...occur, or a combination of both;

- (v) a method which utilizes mechanical or physical or **chemical** actions within the processing operation to keep the processing equipment as physically clean and debris...

...or the rate of oxidation reaction occurring within the product and thus maintain the highest **meat** quality attributes or even enhance the **meat** quality.

A preferred type of embodiment is a method which pre"ferably undertakes, all material...

...ensure it substantially remains in the range -20C to 00C without causing freezing of the **meat** or **foodstuff** or if processing operations cause deviation from the desired range, it returns, through...

...if possible organic, **foods** and an increasing regulatory requirement for reduction or elimination of artificial **chemicals** and preservatives in such **foods**, particularly **meat** and **meat** products, it is alarming to note that many proposed methods for decontaminating **meat** and other **foodstuffs** rely on the addition of **chemicals** not normally found in or on such **foodstuffs** or by irradiating such **foodstuffs** with ionising radiation.

In accordance with one aspect of this invention, it has been found that exposing **meat** surfaces to an introduced atmosphere predominantly of gaseous Carbon Dioxide during all practical stages of...

...has resulted in a significant reduction in the total numbers of viable microorganisms compared with **meat** not so treated. For the purpose of definition, the Carbon Dioxide atmosphere means a.n...

...that the effect is still further enhanced when the temperature of the surface of the **meat** is kept substantially at OOC or below but not lower than -2'C such that...

...gas in any liquid or other carrier prior to or during any contact step.

Many **chemical** methods which rely on, if not entirely, at least in part, the lowering of pH...

...liquids not only to provide suitable dilutions thus preventing the introduction of deleterious physical and **chemical** properties to the **foodstuff** being treated, but also to effect an even distribution around the...

...further aspect of this invention it has been found that with the surfaces of the **meat**, **meat** product or other **foodstuff** substantially exposed to the Carbon Dioxide atmosphere, the addition of other...

...or germicidal UV alone.

These specific conditions produce a very substantial microbiocidal reduction in both **pathogenic** bacteria and total viable counts for a very wide variety of **foodstuffs**. However, very occasionally...

...when the **foodstuff** has a very heavy total microbial load or contains some very specific **pathogens**, a more extensive decontamination treatment has been necessary to ensure a satisfactory reduction for processing...

...equipment components as necessary.

This may be in the form of scrapers, brushes, air **jets**, **water jets** or similar actions where the surface to be cleaned has occasion to be presented to...

...used in a sausage or product formulation or a changed physical state for example lean **meat** in a substantially frozen or tempered state. These may be within a substantially continuous processing...

...are substantially deleterious to a number of attributes related to product quality. For example, **meat** in the presence of air or oxygen will irreversibly change colour from an initially attractive...

...absence of air or oxygen. However, the attractive Oxymyoglobin is easily reformed when the **meat** is re-exposed to air in a controlled manner, for example, within a modified atmosphere...

...the absence of air or oxygen is the minimising or elimination of deleterious **biochemical** and **chemical** reactions within the **foodstuffs** which result in a reduced keeping quality of the **foodstuff**, an...

...a decontaminating effect on its own, they do not allow the immediate surface of the **meat** or other **foodstuffs** to become sufficiently low in pH to enable the synergistic microbial reduction...

...Light or more particularly reactions such as photo-oxidation or photo-degradation which reduce overall **meat** or **food** quality are initiated, amplified and/or accelerated by the presence of natural light...

...that the effect is still further enhanced when the temperature of the surface of the **meat** or other **foodstuff** is kept substantially at OOC or below but not lower than -20C...

...Embodiments

Example 1:  
Production of Formed and Filled Chicken Patties using Frozen and/or Chilled **Meat**  
The apparatus is shown, highly schematically, in Fig 1.  
Frozen chicken **meat** of 3 different types, breast **meat** with less than 5% fat; breast trim with less than 15% fat and chicken skin...

...reference to an internal supplier database detailing specific supplier composition performance.  
The blocks of chicken **meat** 10 are removed from their boxes and weighed (at a weighing station 12). optionally if...

...frozen or tempered blocks rises evenly to a temperature above freezing such that all the **meat** is thawed. Preferably the final equilibrated temperature should be between -2'C and 0'C...

...the energy source 22 is preferably microwave or Rf.  
When available, use of fresh chilled **meat** in place of frozen and thawed **meat**, is-a preferred option. This **meat** should also enter into the processing system between -20C and 0'C.  
If cooling is...

...one or more of the preferred embodiments previously described.  
It is well known that trim **meat** has a much higher content and occurrence of bone and bone fragments than whole muscle and for safety reasons it is preferable to pass the **meat** through a detection and removal system 24 so that all such bone can be automatically detected and removed from the **meat** prior to processing. This can be achieved by a number of 27 different methods but...

...reduce the size of the material at this time as the thawed trim and breast **meat** is of a size suitable for passage through the detection system. However if larger material is used, for example whole muscle turkey **meat**, provision is made to reduce the **meat** size to that of 7.5cm or less by passage through a conventional **meat** pre-grinder or any other suitable method. However the larger the pieces of **meat** and the less the cutting of the material, the better the level of detection as...

...Such a method also allows for the detection and rejection of other contaminants in the **meat** and their immediate rejection.  
It may also be necessary to fine tune the product formulation...

...batch techniques can be used.  
Moisture measurements are similarly be undertaken simultaneously within the constrained **meat** flow by various established methodologies such as electrical conductance or Infra Red reflectance. This can be directly in the flow of the **meat** anywhere along its constrained flow or preferably

as it passes into or out of the...  
 ...can be used. 28  
 With two such measurements, in a material such as boneless chicken **meat** and in the absence of any additional components, protein can be determined by difference, i...  
 ...total fat and total moisture content together and deducting that from the total weight of **meat** analysed. Once the **meat** has been measured and providing it is within the acceptable temperature range, it now enters the aseptic, or essentially aseptic, part of the system 26. The **meat** is passed through a grinder 28 where it is reduced to its final desired particle...  
 ...with one or more further product **streams** 32) or into intermediate storage containers. As the **meat** passes to these containers or the blender (or earlier if already of acceptable particle size...  
 ...wavelength UV-C light around most or all of its surface such that all the **meat** passing along it is exposed to the UV-C light, the duration of which is...  
 ...a reduction of total microbial organisms and an elimination of all microorganisms considered to be **pathogenic**, for example, E.coli, Salmonella, Listeria and Campylobacter. However the sources 34 of UV-C...  
 ...by exposing the particles to acidification, i.e. lowering the pH normally found in such **meat**, i.e. 5.5 - 5. The use of **water** or other solutions is undesirable as...  
 ...environment because of the inherent danger they pose to humans and the undesirable physical or **chemical** effects they cause to the **meat** itself. A practical and suitable alternative is Carbon Dioxide. Excess of the gas is exposed to the **meat** immediately prior to, during and immediately after exposure to the UV-C. The amount of...  
 ...before and after the UV-C treatment may be such that it commences before the **meat** enters the measurement system and continues to some suitable point in the operation after holding...

English Abstract

A cleaning apparatus (91) for cleaning substance surfaces such as concrete, tiles, pavers, etc. The cleaning apparatus has an enclosed head (2) which is substantially concave in shape, and, an inlet hose (3) connected to the head to supply a high **pressure** liquid **jet**. The hose is preferably connected by a universal joint (4) to enable three-dimensional movement. The supply of the liquid **jet** cleaning fluid is regulated by a hydraulic circuit and is preferably powered by an automobile engine, for transportability.

ABSTRACT EP 634246 A1

A computer-controlled robot **cutting** system for making angled or beveled **cuts** along a preselected path in a workpiece having a generally planar **cutting** surface. A **cutting** knife, such as a high-intensity fluid **jet**, is pivotably mounted in a support frame having two pairs of arcuate guides disposed at right angles to each other for motor-driven rotation of the **cutting** knife about orthogonal axes. The centers of curvature of both guides lie on a critical plane containing a pivot point about which the **cutting** knife pivots. An opposing workpiece gantry with horizontal and vertical slides for motor-driven translation of the workpiece along two axes also includes means for holding the workpiece such that its surface to be **cut** faces the **cutting** knife and lies in the critical plane. The workpiece is thus translated to define the **cutting** path on the obverse surface, while the **cutting** knife is pivoted to define the entry angle of the **cut** along the **cutting** path. Four motion controllers under computer control coordinate the motors driving each axis of rotation or translation. Because the obverse **cutting** surface of the workpiece is maintained in the critical plane containing the pivot point, pivoting of the knife does not change its entry point in the **cutting** surface, thereby simplifying motion control algorithms. Furthermore, because the **cutting** knife is pivoted and the workpiece is translated, the relatively massive gearing and movable frame structures are distributed between the **cutting** knife section and the workpiece gantry, lowering the inertia and enabling the use of lighter-duty motors. English Abstract

The invention relates to a machine for **cutting vegetables** into

pieces. The inventive machine comprises a conveyor (1) for transporting the products that are to be cut into pieces which consists of V-shaped conveyor meshes (6), defining independent, parallel longitudinal paths, and which passes through a cutting zone. The aforementioned cutting zone is provided with an operating assembly (2) comprising pressurised water jet -type cutting heads (10) which correspond to the longitudinal transport paths. Said cutting heads are disposed so as to be adjustable in terms of height and oblique or perpendicular transverse orientation in relation to the conveyor meshes (6).

Abstract (Basic): EP 223111 A

Method comprises using a **water jet** discharging from an orifice  
at 30,000-50,000 psi pressure to **cut** a fresh **fruit or vegetable**

so as to minimise bruising throughout the **cut** pieces and tissue damage at the **cut** surfaces.

USE/ADVANTAGE - The **cutting method** is partic. useful for **vegetables** such as carrots (claimed), celery (claimed), cucumber, green pepper, lettuce, cabbage, **potatoes**, turnips, rutabaga, string beans, radishes, rhubarb and swiss chard, and **fruits** such as oranges, grapefruit, lemons, limes, apples, pears, pineapples, cantaloupes, honeydew melons and water melons. Tissue damage due to compression and tearing is minimised. The shelf life of the **cut fruit or vegetables** is prolonged. **Microbial** and enzymatic damage is slowed down due to the formation at the **cut** surfaces of a very thin dry layer.

0/0

Abstract (Equivalent): US 4751094 A

Improved method of **cutting a fresh fruit and vegetable** comprises contacting with a **water jet** discharged from an orifice at 30,000-50,000 psi to **cut fruit or vegetable** into pieces, such that bruising and damage to tissue near the **cut** surface is minimised throughout. Pref. **water jet** discharges from orifice of dia. 0.003-0.012 ins.

USE - To cut carrots or celery, or other fresh root **vegetables**, leafy **vegetables**, or those having firm tissue. **Fruits** (e.g. oranges, grapefruits, lemon, etc) can be similarly treated. (4pp)
